ABSTRACT. A new species, *Gongylidiooides protegulus* sp.n., is described from Chiayi and Pingtung counties of Taiwan. The new species differs from the known congeners by the structure of the copulatory organs, mainly by the long, thin, looped embolus and conically protruded, membranous protégulum, as well as by the shape of the epigynal ventral plate.

РЕЗЮМЕ. Из двух округов Тайваня, Цзяи и Пин-дун, описан новый вид *Gongylidiooides protegulus* сп.н. Вид отличается от ближайших представителей рода структурой копулятивных органов, а именно, длинным, тонким, кольцевым эмболясом, конически вытянутым мембранизированным протегулумом, а также специфической формой вентральной пластины эпигини.

Introduction

Currently, the spider genus *Gongylidiooides* Oi, 1960 includes 17 species, distributed in southeastern Palaearctic and in the Oriental Region [World Spider Catalog, 2018]. The genus is relatively well studied due to several publications including a regional revision of Chinese species [Tu, Li, 2006]; a survey of species occurring in Japan [Ono et al., 2009] and some occasional descriptions [Tanasevitch, 2011; Yin et al., 2012]. Two species, *G. angustus* Tu et Li, 2006 and *G. dielipticus* Song et Li, 2008, have been described from Taiwan [Tu, Li, 2006; Song, Li, 2008] and since then they have not been found anywhere. While studying material recently collected in southern part of Taiwan,

we found a new species of *Gongylidiooides*, a description of which is given below.

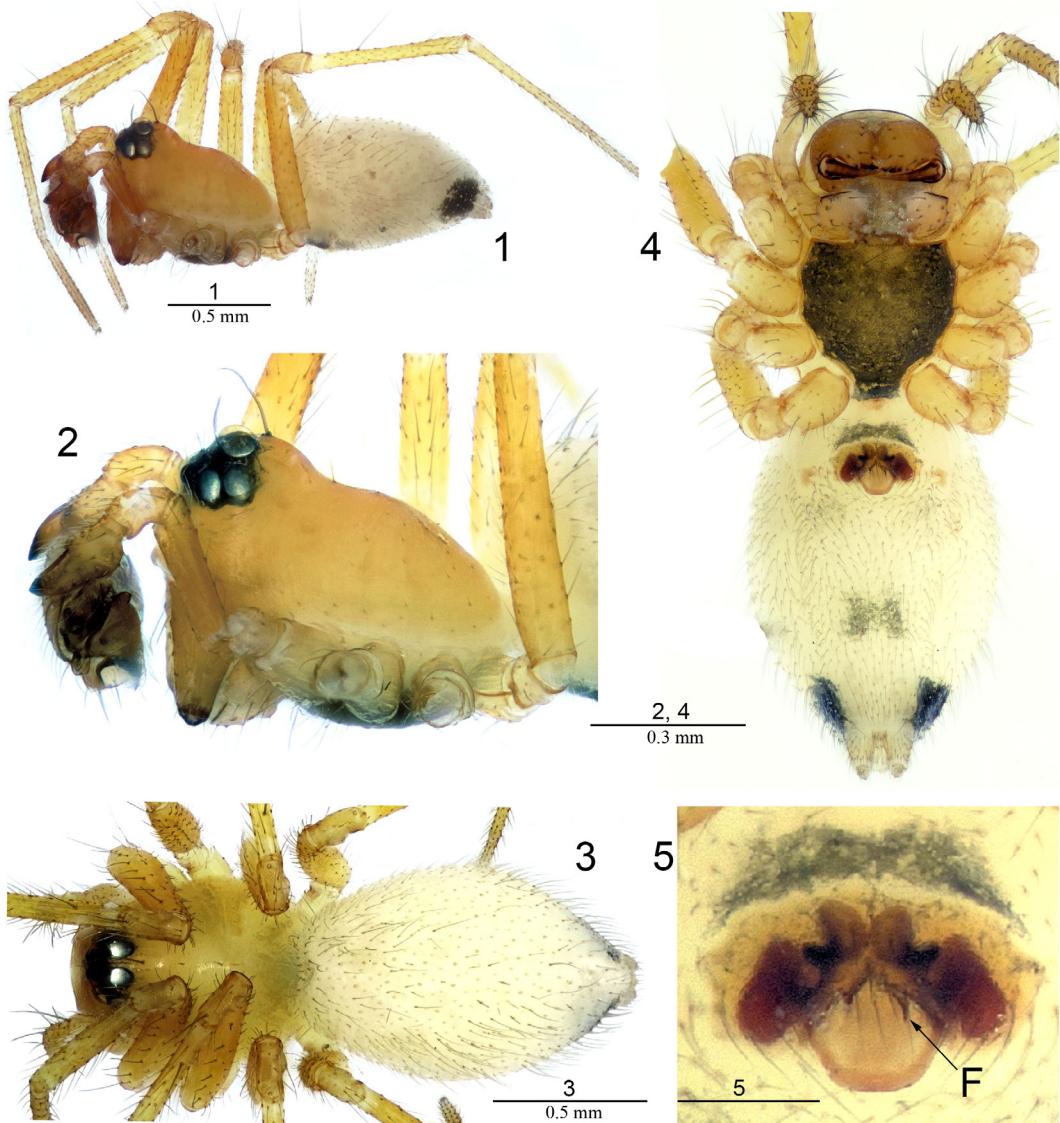

Material and methods

This paper is based on material kept at the Muséum d'histoire naturelle de Genève, Switzerland (MHNG), as well as collected by junior author and Peter Jäger in Taiwan in 2013. Type material is shared between the MHNG; the National Museum of Natural Science, Taichung, Taiwan (NMNS); the Senckenberg Museum, Frankfurt am Main, Germany (SMF); the Zoological Museum of the Moscow State University, Moscow, Russia (ZMMU); and the Zoological Museum of Turku University, Turku, Finland (ZMTU).

Specimens preserved in 70% ethanol were studied using a stereomicroscope MBS-9. Photographs were taken using different-sized dishes with a paraffin layer on the bottom, using an Canon EOS 7D camera attached to an Olympus SZX16 stereomicroscope and with a SEM JEOL JSM-5200 scanning microscope at the Zoological Museum, University of Turku. Digital images were prepared using the “Combin-eZP” image stacking software.

The terminology of copulatory organs mainly follows that of Merrett [1963], Hormiga [2000] and Tanasevitch [1998, 2015]. The chaetotaxy is given in a formula, e.g., 2.2.1.1, which refers to the number of dorsal spines on tibiae I–IV. The sequence of leg segment measurements is as follows: femur + patella + tibia + metatarsus + tarsus. All measurements are given in mm. All scale bars in the figures correspond to 0.1 mm, unless indicated otherwise. Figure numbers are given above the scale lines, the corresponding distance below.

The following abbreviations are used in the text in figures: C — convector *sensu* Tanasevitch [1998] (= lamella *sensu* Merrett [1963]); D — duct; DAC — distal apophysis of convector *sensu* Tanasevitch [2015]; DSA — distal suprategular apophysis *sensu* Hormiga [2000]; E — embolus; F — fold; Fe — femur; LEC — lateral extension of convec-

Рис. 1–5. *Gongylidiooides protegulus* sp.n., ♂ (1–2) и ♀ (3–5) паратипы из округа Пиндуна. 1 — ♂ тело, вид сбоку; 2 — ♂ просома, вид сбоку; 3–4 — ♀ тело, вид сверху и снизу, соответственно; 5 — эпигина, вид снизу.

tor *sensu* Tanasevitch [2015]; FD — fertilization duct; MC — main body of convector; Pro — protégulum; Re — receptacle; RTA — retrolateral tibial apophysis; T — tegulum; TMI — position of trichobothrium on metatarsus I; VP — ventral plate.

Description

Genus *Gongylidiooides* Oi, 1960

Type species: *Gongylidiooides cucullatus* Oi, 1960, by original designation and monotypy.

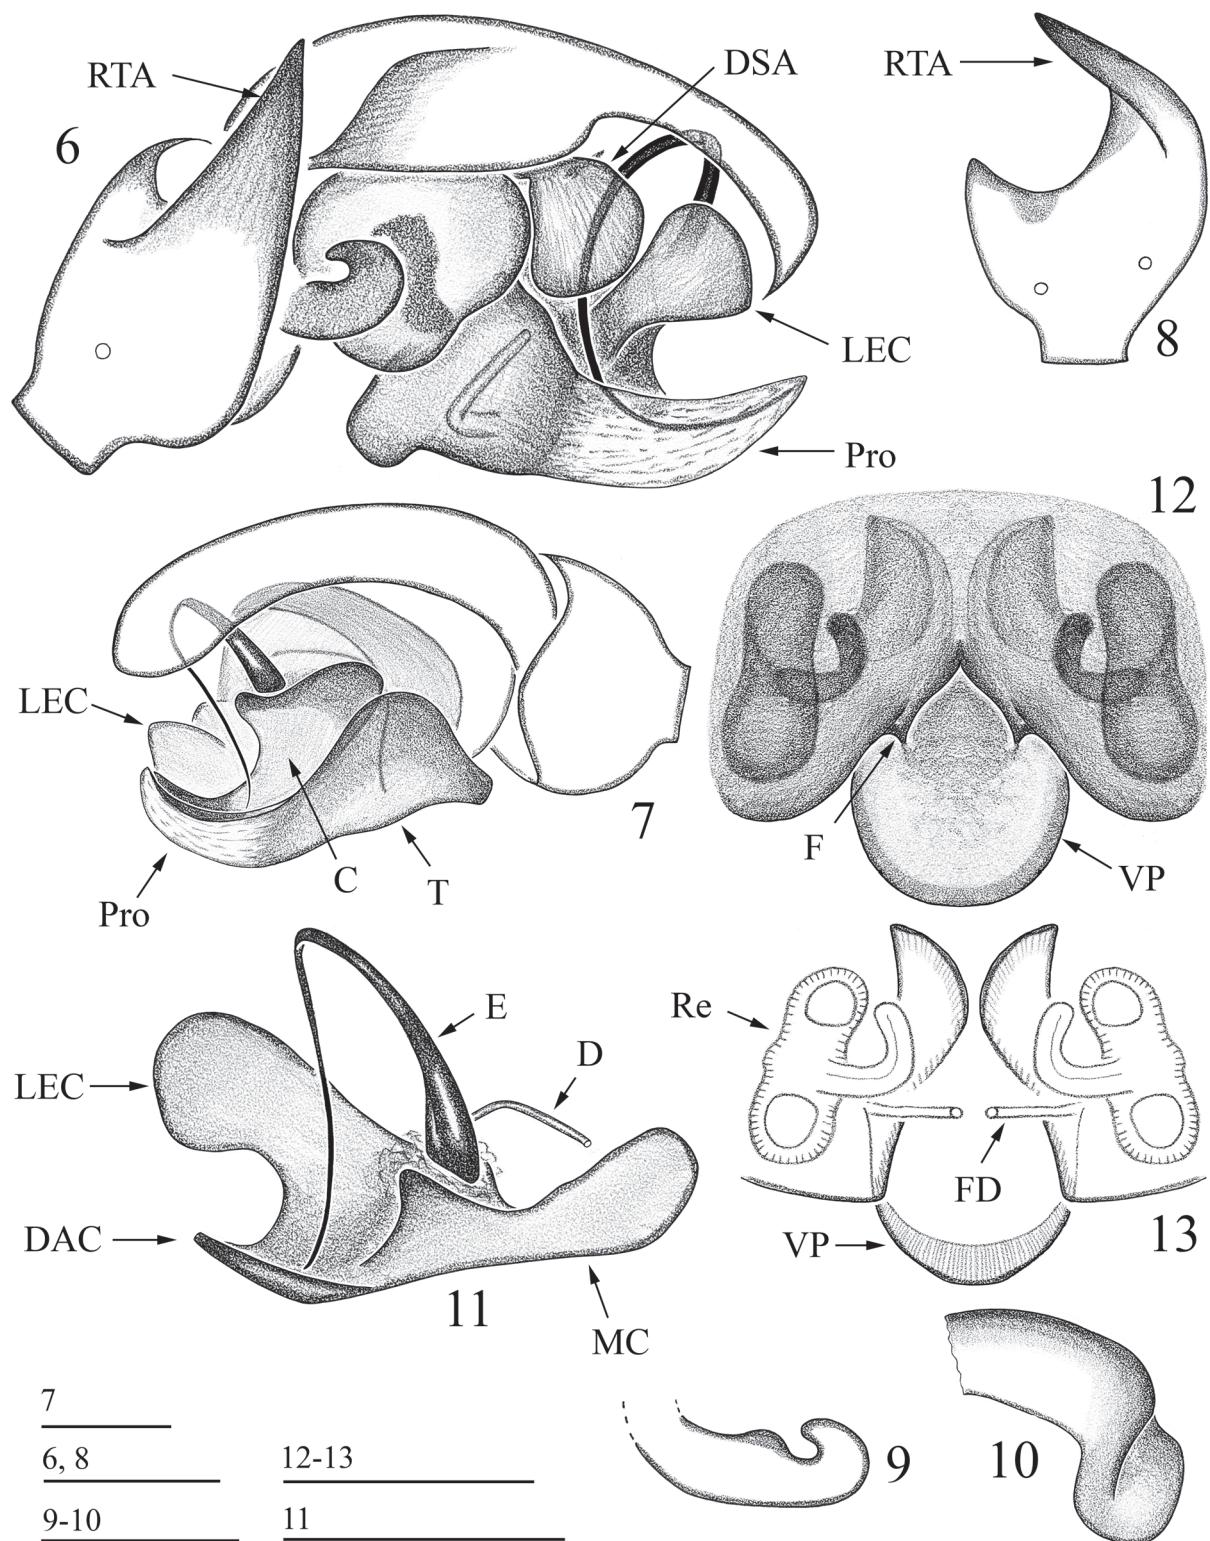

Gongylidiooides protegulus sp.n.

Figs 1–17.

HOLOTYPE ♂ (MHNG), TAIWAN, Chiayi County, Alishan, Rd. 129, km 15.5, after Tanaigu, 600 m a.s.l., dead leaves, 13.IV.2009, leg. S. Vit [TAIW-09/22].

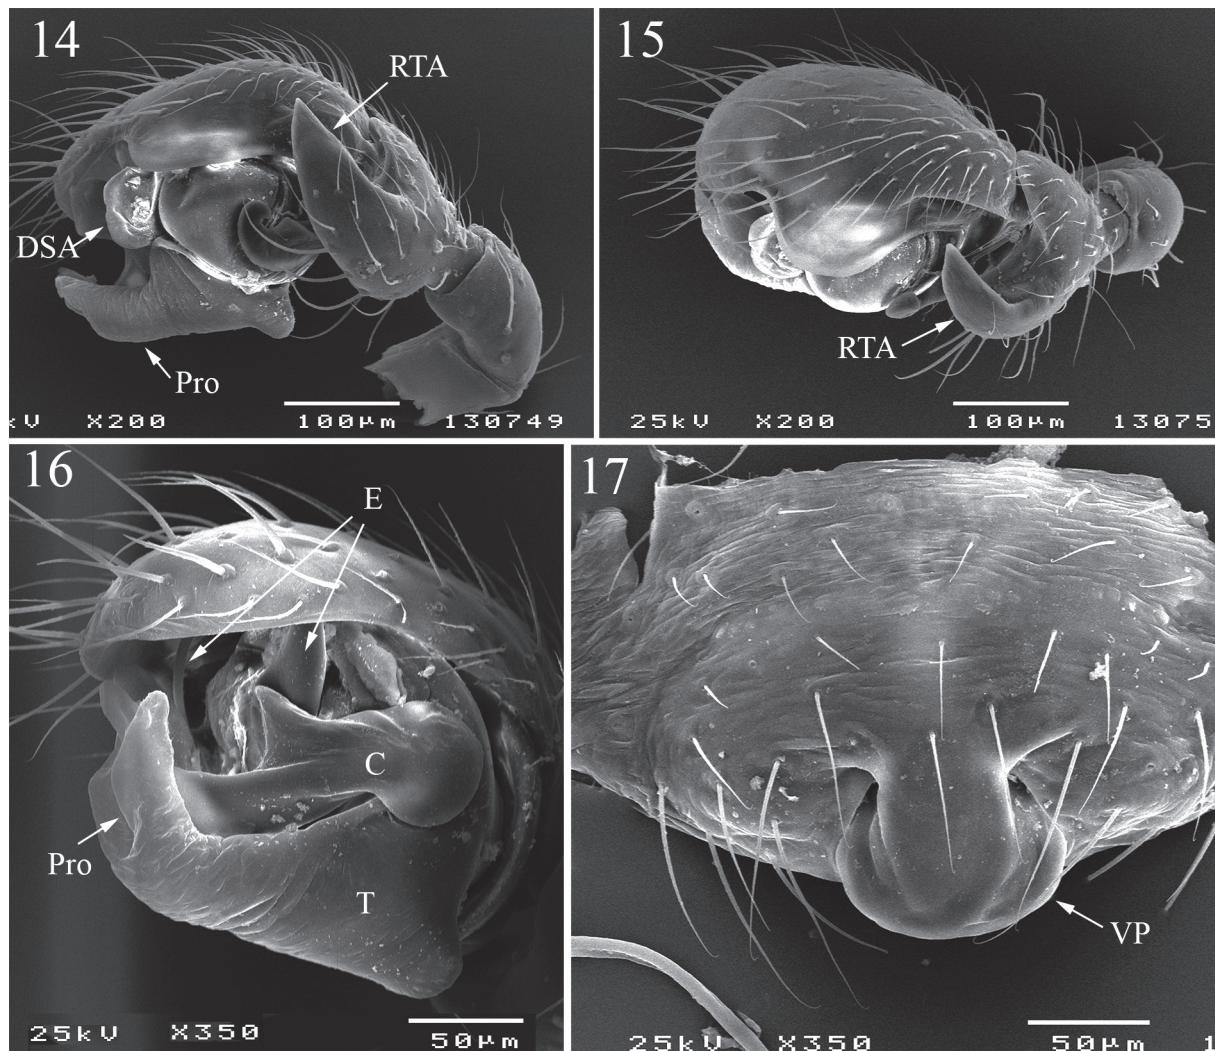

PARATYPES: 1 ♀, collected together with holotype; 1 ♂, 6 ♀ (NMNS), 2 ♂♂, 7 ♀♀ (ZMMU), 2 ♂♂, 4 ♀♀ (ZMTU), TAIWAN, Pingtung County, Kenting National Park, 21°58'N 120°50'E, sifting litter, hand picking among grass and stones, 26.VI.2013, leg. Y. Marusik; 3 ♀♀ (SMF), Kenting Nature Park, 21°57'25.97"N 120°49'13.29"E, 200 m a.s.l., disturbed primary forest, limestones, at day, by hand, 26.VI.2013, leg. P. Jäger.

DIAGNOSIS: *Gongylidiooides protegulus* sp.n. is most similar to *G. angustus* Tu et Li, 2006, a species also known from Taiwan. The new species can be distinguished by the falcate retrolateral outgrowth of the palpal tibia (almost straight in *G. angustus*), by the significantly thinner and longer embolus (Figs 6–7, 11 cf. Figs 2(c–g) in Tu & Li [2006]), by the shape of the convector (named as lamella

Figs 6-13. *Gongylidioides protegulus* sp.n., ♂ (6-11) and ♀ (12-13) paratypes from Pingtung County. 6-7 — right palp, retrolateral and prolateral views, respectively; 8 — palpal tibia, dorsal view; 9 — paracymbium; 10 — distal suprategular apophysis, lateral view; 11 — embolic division; 12 — epigyne, ventral view; 13 — cleared epigyne, dorsal view.

Рис. 6-13. *Gongylidioides protegulus* sp.n., ♂ (6-11) и ♀ (12-13) параптипы из округа Пиндуна. 6-7 — правая пальпа, ретролатерально и пролатерально, соответственно; 8 — голень пальпы, вид сверху; 9 — парасимбиум; 10 — дистальная супратегулярная апофиза, вид сбоку; 11 — эмболиусный отдел; 12 — эпигина, вид снизу; 13 — просветленная эпигина, вид сверху.

Figs 14–17. *Gongylidioides protegulus* sp.n., ♂ (14–16) and ♀ (17) paratypes from Pingtung County. 14–16 — left palp, retrolateral, dorsal and ventral views, respectively; 17 — epigyne, ventral view.

Рис. 14–17. *Gongylidioides protegulus* sp.n., ♂ (14–16) и ♀ (17) паратипы из округа Пиндуна. 14–16 — левая пальпа, ретролатерально, дорсально и вентринально, соответственно; 17 — эпигина, вид снизу.

characteristica in Tu & Li [2006]), as well as by the conically protruded, almost transparent, membranous protégulum in male. The females of new species differ by the parallel configuration of the receptacles (diverging in *G. angustus*), as well as by the presence of two small, pointed folds (F in Figs 5, 12) on the anterior wall of the epigyne, which translucent through the ventral plate. In addition, receptacles are larger than copulatory ducts in *G. protegulus* sp.n. and smaller in *G. angustus*.

ETYMOLOGY: The specific name is a noun in apposition, refers to a large and long protégulum.

DESCRIPTION: Male (paratype from Pingtung County). Total length 1.83, habitus as in Fig. 1. Carapace weakly modified: cephalic area slightly elevated, bearing a spine, directed anterodorsally as shown in Fig. 2; 0.80 long, 0.65 wide, yellow to pale brown. Eyes slightly enlarged, lateral eyes equal in size to posterior median, sulci absent. Sternum and labium almost black. Chelicerae 0.28 long. Legs and palps yellow. Leg I 2.91 long ($0.75 + 0.25 + 0.75 + 0.68 + 0.48$), IV 2.86 long ($0.75 + 0.23 + 0.73 + 0.70 + 0.45$).

Chaetotaxy 2.2.1.1, length of spines about 1.5–2.5 diameters of corresponding segment. TmI 0.65. All metatarsi with a trichobothrium. Palp (Figs 6–11, 14–16): tibia with a large, falcate retrolateral apophysis. Cymbium without posterodorsal process. Paracymbium narrow, L-shaped. Tégulum with a basal, rounded projection, distally with a conically, well-protruded, almost transparent membranous protégulum. Median membrane reduced. Convector massive, its distal apophysis narrow, pointed, lateral extension expanded distally. Radix reduced, embolus long, narrow, making a loop. Abdomen 1.08 long, 0.63 wide, dorsally white, ventrally with two black spots near spinnerets as in Fig. 1.

Female (from Pingtung County). Total length 1.88, habitus as in Figs 3–4. Carapace unmodified, 0.83 long, 0.68 wide, eyes normal. Chelicerae 0.38 long. Leg I 2.81 long ($0.75 + 0.25 + 0.73 + 0.63 + 0.45$), IV 2.76 long ($0.78 + 0.20 + 0.75 + 0.63 + 0.40$). TmI 0.67. Epigyne (4–5, 12–13, 17): ventral plate narrowing anteriorly; expanded, rounded and well-protruded distad. Anterior wall with two small, pointed folds (F in Figs 5, 12), which translucent through

the ventral plate. Receptacles bean shaped. Abdomen 1.08 long, 0.75 wide, dorsally white, ventral pattern as in Fig. 4. Prosoma and leg coloration, chaetotaxy, as in male.

DISTRIBUTION: Known only from Chiayi and Pingtung counties in Taiwan.

Acknowledgements. We are most grateful to Peter Schwendinger (MHNG) and Peter Jäger (SMF) for the opportunity to work with the museum collections under their care.
